

Title: Deep Learning and Layout Coordinates Reconstruction System.

Abstract: Traditional text extraction techniques ignore formatting vectors [1]. We address this by keeping layout coordinates. Let our page bounding boxes be represented by coordinate variables $B = (x_0, y_0, x_1, y_1)$. The regression formula is defined by the inline representation $\text{Loss} = \sum ||B_i - \hat{B}_i||^2$. This enables reconstruction of academic outputs.
